- [Fan modification](#)

Fan modification

Introduction

This is a guide that shows you a way how you can change the fans in your supermicro CSE876 case. There are multiple versions of 80 * 80 fan cases available some are easier to use for this modification than others. In the next section I will introduce two fan case variation.

Fan cases

In the picture above you can see that the FAN-0126L4 case has a notch that makes it harder to drop in standard (less thick e.g. 25 mm) fans.

The FAN-0094L4, 672042020317 case on the right does not have this notch and can be easily used for this mod.

Remove the original fan from the case

Release all screws that hold the fan

Take the fan out of the case

Release the cable from the fan

Cut the cable from the fan, remember, just do this if you do not need the original fan anymore, since it might be hard to power it after this modification.

Now we have the original socket, we will now proceed to crimp on sockets.

Crip the cable

Get your tools ready for crimping the cable

Take of a few millimeters of cable isolation of each cable

Dont crimp on these connectors

You will need the male connectors and a socket

Insert the connectors into the 4 PIN socket

Put it together

Now you can install your custom fan, put the fan cable through the cable hole.

Mount the fan with the original screws

Install the original socket and put the clip back

Connect the custom fan with the socket we crimped to the original cable

Install custom fan

Slide in the custom fan
