

# migration

These commands will migrate one zfs pool to another server using netcat

```
zfs snapshot -r data@migrate_20200215  
zfs list -t snapshot  
zfs send -R data@migrate_20200215 | nc -l 3333
```

On the remote server you can execute

```
nc 10.7.10.71 3333 | zfs recv -Fd data
```

The version with netcat performed with much higher transference speed than if you would use ssh.
